

Goal

To create a **Gmail Management Service** that helps users manage their inbox by **collecting, analyzing, categorizing, and summarizing their emails**.

The service will automatically fetch emails received within the previous **24 hours** and analyze them based on their importance and type. Emails can be categorized into groups such as **Important, Normal, Promotional, and Spam**, helping users quickly identify which emails require their attention and which are promotional or unwanted.

After analyzing the emails from the past 24 hours, the service will generate an **Email** containing important information such as the **sender, subject, and action buttons** for managing each email, such as **Delete, Archive, or Mark as Important**. The generated digest will be automatically delivered to the user at a **scheduled time**.

Key Features

1. Email Categorization

- Categorize emails into **Important, Normal, Promotional, and Spam**.

2. Email Summarization

- Provide a concise summary of each email.

3. Action Buttons

- **Delete** an email.
- **Archive** an email.
- **Mark as Important**.
- **Mark as Spam**.
- **Send to User**.
- **Reply** to an email.
